

# My Pet Set Theory: AST+NWF

poypoyan

17 Aug 2023

## Abstract

In this note we present a variant of Ackermann Set Theory (AST) with easy construction of non-well-founded sets (NWF). Motivations for using up our time for this are also laid out.

## 1 The Theory

We will now describe a variant of Ackermann Set Theory [1] we denote as AST+NWF. AST+NWF is formulated in first-order logic with equality and with a constant  $V$  which is interpreted as the set universe, and a binary relation  $\in$  which is interpreted as the usual membership relation.

**Definition 1.1** (Super-Completeness of  $V$ ). *Let  $SC(V)$  be the statement*

$$\forall x, y (x \in V \wedge (y \in x \vee y \subseteq x) \rightarrow y \in V)$$

where  $\subseteq$  is the usual subset relation, defined as  $x \subseteq y \leftrightarrow \forall z (z \in x \rightarrow z \in y)$ .

Now here are the axioms of AST+NWF( $V$ ):

1. Axiom of Extensionality  $\text{Ext}(V)$ :

$$\forall x, y (x \in V \wedge y \in V \wedge \forall z (z \in x \leftrightarrow z \in y) \rightarrow x = y).$$

2. Ackermann Schema  $\text{Ack}(V)$ : Let  $\phi(y, z_1, \dots, z_n)$  be any unary first-order formula where the all the free variables  $z_1, \dots, z_n \in V$  and  $\neq V$ . Then

$$(SC(V) \rightarrow \forall y (\phi(y, \dots) \rightarrow y \in V)) \rightarrow \exists x (x \in V \wedge \forall y (y \in x \leftrightarrow \phi(y, \dots))).$$

3. **Back** Ackermann Schema  $\text{BAck}(V)$ : Let  $p$  be an  $(m+1)$ -ary predicate. Let

$$\phi(y, z_1, \dots, z_m, z_{m+1}, \dots, z_{(k-1)m}, z_{(k-1)m+1}, \dots, z_{km}, a_1, \dots, a_n)$$

be any unary first-order formula where all the free variables (all except  $y$ ) are  $\in V$  and  $\neq V$ , and there are  $k$  instances of  $p$  in  $\phi$ :

$$\begin{aligned} & p(y, z_1, \dots, z_m) \\ & p(y, z_{m+1}, \dots, z_{2m}) \\ & \vdots \\ & p(y, z_{(k-1)m+1}, \dots, z_{km}). \end{aligned}$$

Then if

$$\forall x \forall y (y \in x \leftrightarrow \phi(y, \dots)) \rightarrow p(x, b_1, \dots, b_m)$$

and

$$\forall x \left( \bigwedge_{i=0}^{k-1} p(x, z_{im+1}, \dots, z_{(i+1)m}) \rightarrow x \in V \right) \rightarrow (SC(V) \rightarrow \forall y (\phi(y, \dots) \rightarrow y \in V)),$$

then

$$\bigwedge_{i=0}^{k-1} \left( \exists! x (p(x, z_{im+1}, \dots, z_{(i+1)m})) \right) \wedge$$

$$\forall x (p(x, z_{im+1}, \dots, z_{(i+1)m}) \rightarrow (x \in V \wedge \forall c_1, \dots, c_m \left( \bigvee_{j=1}^m c_j \neq z_{im+j} \rightarrow \neg p(x, c_1, \dots, c_m) \right))).$$

## 2 Motivations

There are several motivations for the “design” of the theory.

The first motivation is the focus on *set constructions* instead of sets and/or proper classes. Because of this, we decided to:

- Adopt AST in the first place. The Ackermann schema captures the idea that “natural”/“uncontroversial” set constructions are 1) definable as a first-order sentence (hence, are “finite”), and 2) “universe-agnostic” (since those do not mention  $V$ ). This reminds us while studying infinities that our “full” descriptions of objects are always finite.

On the contrary, consider the Axiom of Choice (AC), a well-known axiom independent to ZF. The sets it constructs are not unique, hence it is said to postulate existence of sets without defining it, unlike other ZF (set construction) axioms [2, Chapter 5]. However, if we just permit “lengths” of any ordinal to  $\phi$  in Ackermann Schema, AC can now “produce” unique sets again! To see this, let  $S$  be a set of sets, then an appropriate  $\phi$  for AC would simply be

$$y = a_0 \vee y = a_1 \vee y = a_2 \vee \dots$$

where  $a_0 \in s_0, a_1 \in s_1, a_2 \in s_2, \dots$  and  $S = \{s_0, s_1, s_2, \dots\}$ .

- Remove the Class Construction Schema for our AST+NWF. Note that Class Construction Schema *is* Separation Schema for  $V$  and that Separation Schema immediately follows from Ackermann Schema by setting  $\phi$  to  $y \in a \wedge \varphi$  for  $a \in V$ .

The next motivation is to make the universe(s) “as closed as possible”. Because of this, we decided to:

- Restrict Extensionality to sets ( $x \in V$ ) only.
- Put super-completeness inside Ackermann schemas instead of it being an axiom on its own. This is done so that when we work on multiple universes  $V_0 \subset V_1 \subset \dots$  where  $\text{AST-NWF}(V_0) \wedge \text{AST-NWF}(V_1) \wedge \dots$ , no additional sets in  $V_0$  will be shown to exist through the higher universes  $V_1, \dots$ , and *not* through Ackermann schemas for  $V_0$ .

Now the Back Ackermann Schema is formulated for easy construction of non-well-founded sets, but it looks spooky and extremely complicated. Nevertheless, the intuition is actually simple:

If potential non-well-founded sets (the instances of  $p$  in  $\phi$ ) are used to successfully construct another version of  $p$  (via  $\phi$ , in Ackermann Schema sense) *assuming that those are all sets*, then those are indeed sets, and *no other version of  $p$  should ever be equal to those*.

For example, to construct a set such that  $x = \{x, a\}$  where  $a \in V$ , the  $m$  of  $p$  is simply 1 (as in  $p(y)$ ), and  $\phi(y, \dots)$  is simply  $p(y) \vee y = a$ .

Lastly, the last highlight in the above quote, the statement “no other version of  $p$  should ever be equal to those”, needs explanation. Our main motivation for this is the “intuitive” set-theoretic definition of ordered pair  $(x, y) = \{(0, x), (1, y)\}$ . For this to satisfy the ordered pair property  $(x_0, y_0) = (x_1, y_1) \leftrightarrow x_0 = x_1 \wedge y_0 = y_1$  in our theory, the newly proved non-well-founded sets  $(0, x)$  and  $(1, y)$  should *always* be unequal. Since by the nature of non-well-founded sets we cannot “view inside”  $p$ , there is freedom on equalities between the newly proved non-well-founded sets. Hence the statement can be seen as either a “cheat”, or the most natural generalization of the always inequality between  $(0, x)$  and  $(1, y)$ .
